

Giles Butler

Senior Product Designer | Design Engineer | Product-minded designer-builder

im@giles.io | giles.io | UK | Remote | Comfortable with Brazil and US overlap

Profile

Senior product designer and design engineer with 15+ years in tech, 10+ years building startup products, and more than 25 years making electronic music. I work across product thinking, interaction design, UI craft and code, using prototypes to answer design questions quickly and turn complex systems into clear, useful experiences.

Core strengths

- Complex product design from problem framing through shipped implementation
- Design engineering, frontend systems, component-driven architecture and coded prototyping
- AI-native UX that makes powerful, probabilistic systems feel understandable and controllable
- Product development informed by customer support, direct conversations and rapid iteration
- Recording, MIDI, mixing, routing, signal flow, VST/AU plugins, hardware, synths and samplers

Selected experience

Co-Founder, Fuzzy Logic Labs | 2016 to present

Co-founded a digital agency and startup studio. Built products including Mixo, Mixvisor, Userfold and Room for Sound, working across product direction, design, frontend and backend engineering, growth, support and company operations.

Product Engineer & Product Manager, LawPath | 2016 to 2017

Led the company registration product across product strategy, design, frontend engineering, third-party APIs and ASIC integration, with ownership of product direction.

Lead Engineer, CommBank website rebuild | 2013

Led frontend development across a 20,000-page migration, owning frontend architecture, code review and coordination across design and backend teams.

Selected project: Mixo

AI website builder | Co-founder | Product, design & engineering

Co-founded Mixo to help small businesses get online in seconds, not weeks. I have worked across strategy, UI/UX, frontend architecture, backend services, infrastructure, growth and customer support. The platform has been used by hundreds of thousands of businesses and generated more than three million websites.

- Designed and built AI-assisted flows for non-technical users while keeping the product simple as capability expanded
- Architected and built the Vue 3 application and state modelling with XState
- Repeated requests from customers who wanted to hear from their own visitors led to custom forms, turning generated sites into active feedback and lead-generation tools.

Selected project: Mixvisor

Desktop music app | Solo product, design & engineering | Tauri + Vue

I built Mixvisor from a problem in my own studio: I did not need another way to start music, I needed a better way to return to unfinished sessions and finish more of it. I designed and engineered the desktop app end to end, translating deep familiarity with DAWs and production workflows into the product model and interface.

- Recognises sessions across major DAWs and organises scattered projects around a musician mental model rather than a filesystem
- Designed the product, interaction model and desktop experience, then built the application myself in Vue and Tauri
- Combines music-domain expertise, zero-to-one product work and design engineering in one shipped product

Music background

Producing and DJing since age 12. Degree in Music Production. Released tracks through labels and more recently independently.

Ableton Live user since version 4 and former beta tester. Trained on Logic in the Emagic era. Maintain my own studio and remain active in electronic music, hardware and sampling.

Current practice: recording, MIDI, mixing, routing, signal flow, VST/AU plugins, hardware instruments, synths, samplers and hybrid software/hardware workflows.

How I work

- Use code as a normal design tool. Sometimes the fastest way to answer a design question is to build it.
- Decide where complexity should live: what someone needs now, what can wait, and how much choice is genuinely useful.
- Ship to learn. Use support, customer conversations and real behaviour to challenge assumptions and shape what comes next.
- Treat taste as accumulated judgement: pattern recognition built through years of making, shipping, getting things wrong and refining what deserves to exist.

Tools and methods

- Design: Figma, interaction design, motion, prototyping, design systems
- Frontend: HTML, CSS, JavaScript/TypeScript, Vue, Astro, component-driven architecture, Storybook
- Product and engineering: full stack development, state modelling, testing in isolation, AI-assisted and agentic development workflows
- Studio and audio: Ableton Live, Logic, VST/AU ecosystems, hardware synths and samplers, recording and mixing workflows

Education

Degree in Music Production
